"Complete genome sequence of Neisseria meningitidis serogroup B strain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -i- CATALYTIC ACTIVITY: N-acetyl-L-glutamate 5-semialdehyde + NADP(+) + phosphate = N-acetyl-5-glutamyl phosphate + NADPH.
-i- PATHWAY: Arginine biosynthesis; third step.
-i- SUBCELLULA. LCCATION: Cytoplasmic (Probable).
-i- SUBCELLULA. Belongs to the NAGSA dehydrogenase family. Subfamily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

A. Tidentity of the organic cation transporter OCT3 as the extraneuronal monoamine transporter (uptake2) and evidence for the expression of the transporter in the brain...

T. Biol., Chem. 273:32776-32786(1998).

J. Biol., Chem. 273:32776-32786(1998).

- FUNCTION: Mediates potential-dependent transport of a variety of organic cations. May play a significant role in the disposition of cationic neurotoxins and neurotransmitters in the brain.

- SUMCELIOUAR LOCATION: Integral membrane protein.

- ISSUE SPECIFICITY: HIGHLY EXPRESSED IN PLACENTA WITH MODERATE EXPRESSED, ESPECIALLY IN HIPPOCAMPUS, CEREBELLUM AND CEREBRAL

- COPTEX: EXPRESSION IS LOW IN KIDNEY AND UNDETECTABLE IN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. "Cloning of the mouse and human solute carrier 22a3 (Slc22a3/SLC22A3)
identifies a conserved cluster of three organic cation transporters on
mouse chromosome 17 and human 6q26-q27.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Lerangporter OCT3 in the kidney.";
Am. J Physiol. 279.F449-F458(2000).
-!- FUNCTION: Mediates potential-dependent transport of a variety of organic cations. May play a significant role in the disposition of cationic neurotoxins and neurotransmitters in the brain.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- TISSUB SPECTRICITY: EXPRESSED IN PLACENTA, SKELETAL MUSCLE, PROSTATE, AONTA, LIVER, FETAL LUNG, SALIVARY GLAND, ADRENAL KIDNEY AND BRAIN CORTEX. NO EXPRESSION DETECTED IN SPLEEN.
-!- SIMILARITY: Belongs to the sugar transporter family. Organic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MEDLINE=20425388; PubMed=10966924; Wu X., Huang W., Ganapathy M.E., Wang H., Kekuda R., Conway S.J., Lelbach F.H., Ganapathy V.; "Structure, function, and regional distribution of the organic cation transporter OCT3 in the kidney.";

-1- SUBCELLUIAR LOCATION: Nuclear (By similarity).
-1- SUBCELLUIAR LOCATION: Nuclear (By similarity).
-1- DEVELOMENTAL STAGE: At 10.5 and 12.5 dpc, expressed in the central nervous system. At 14.5 dpc, expressed in the eye (lens and inner neural layer of the retina), in the primitive glomeruli of the developing kidney, in the villi of the gut and in the dorsal root ganglia.
-1- DOMAIN: The coiled coil domain is required for homodimerization (By similarity).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues. Novel

Claim 49; Page 32; 102pp; English.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a residues.

```
peptide loop tragment from an exposed loop of a glownin raccol, process, or cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides with at least one amino acid deleted prior peptides) and a cyclic peptide with at least one amino acid deleted prior concition are used to interfere with angiogenesis. The monocyclic neovascularisation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, head, head or cold crampional, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability or brain. The peptides are used to image blood vessels and lymphatic cor brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to inferfere with at least one biological activity induced by VEGF. VEGF-C or -D and care also used in combination with an anti-inflammatory agent, to treat a continion inflammation, especially rheumatoid arthritis, psoriasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human whose 3-dimensional structure is modelled on the expose loop of human construction relates to a method of producing a monomeric monocyclic peptide by a measuring beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior cyclisation are used to interfere with angiogenesis.

CC cyclisation are used to interfere with angiogenesis.

CC corolisation are used to interfere with angiogenesis.

CC corolisation is diabeted retinopathy, peoriasis, arthropathy, cerebrovascular accident, post-angioplasty restenosis, head, heat or cold craums, substance-induced neovascularisation or lymphanglogenesis.

CC fraums, substance-induced neovascular sequelae, hypertension induced neovascular sequelae, hypertension induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver confiction. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition diabetes induced neovascular communitation in peripheral limbs or in lungs, peritoneal carbity, pleura, or brain. The peptides are used to indeptides are used to indeptice or brain. The peptides are used to indeptides are used to indeptive or brain. The peptides are used to indeptides are used to indeptive or brain at least one biological activity induced by VEGF, VEGF-C or D and chronic inflammation are permeability in hemmatical archival archivity services and chronic inflammation archival archival archivity services and and archivity induced by VEGF, VEGF-C or D and chronic inflammation and priorice and archivity induced archivity induced archival archival and archivity induced archival and archivity induced archival archival and archivity induced archivity induced archival

                                                                                                                                                                                                                 The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human vibose 3-dimensional structure is modelled on the expose loop of human viboric dearbon separation distances on opposite antiparallel strands of a beta-beta carbon separation distances on opposite antiparallel strands of a cyclising the peptide by exidising the cystein ersidues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid delated prior or cyclisation are used to interfere with angiogenesis.

CC cordisation are used to interfere with angiogenesis.

CC characterised by angiogenesis, neovascularisation or lymphangiogenesis.

CC crebrovascular accident, post-angioplasty restenosis, head, heat or cold crauma substance-induced neovascularisation of the liver, excessive correction. The peptides are also used to modulate vascular permeability and mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, ovasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF. Core or and and are also used to interfere with at least one biological activity induced by versulation in combination with an anti-inflammatory agent, to treat a diabetic resident residual activity induced by VEGF. Core or and and activity induced activity seriasis and characterises and correction in the periode are also used to interfere and correction and activity induced by VEGF. Core or band are also used in combination with an anti-inflammatory agent, to treat a diabetic residual activity.
                                                                                                    Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1;

                                                                                                                                                                                                      E.coli transformed with the DNA sequence AAQ79569 are able to catalyse the epoxidation of alkenes. The DNA is derived from Nocardia corallina and comprises 4 open reading frames. ORFs amoA and amoC encode subunits 1 and 2 of the alkene monoxygenase enzyme and ORF amoD encodes a reductase capable of transferring electrons from NADH coenzyme to a monoxygenase.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAR81469-R81472 are protein products of the Nocardia corallina strain B-276 alkene mono-oxygenase gene. The gene encodes 4 protein products amoh, amoB, amoC and amoD derived from the 3 different reading frames of the operon. The gene is useful for the production of indigo via oxidation of indole. Nocardia corallina can be cultured in a medium cong. indole and will readily oxidise the indole yielding indigo into the culture medium. E. coli may also be transformed with the alkene mono-oxygenase gene and (Updated on 16-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human converse of vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betact carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptides, dimeric blcyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis.

To cyclisation are used to interfere with angiogenesis.

To cyclisation or lymphangiogenesis in a mammal with a condition convacularisation or lymphangiogenesis. Necessity the condition is diabetic retinopathy, psoriasis, arthropathy convergences or condition accident, post-angioplasty restences; head, heat or cold cramancioma, vascularised malignant or benign tumour, post-recovery creamens, substance-induced neovascularisation of the liver, excessive chrama, substance-induced neovascular sequelae, or chronic liver sequelar.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human vEGFD (vascular endothellal growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ä

neovascularisation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, hemangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or crauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or -D and chronic inflammation, especially rheumatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and riabetic retinoral periodes.
cyclisation are used to interfere with angiogenesis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          diabetic retinopathy

0
The invention relates to novel foetal polypeptides encoded by polymuclectides comprising one of 477 sequences fully defined in the specification. The foetal polymuclectides and polypeptides are useful in the treatment and diagnosis of diseases such as cancers, immune disorders, growth disorders (e.g. osteoporosis), thrombolytic disorders, nervous system disorders and inflammation. The present sequence is a polypeptide encoded by a cDNA assembled using an expressed sequence tag (EST) found to be expressed in human foetal tissue cDNA libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a bolypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) are useful for treating disorders involving aberrant protein expression or biological activity. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity

and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and cantibodias that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABPP6736-ABP81046 represent nucleic acid molecules of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               manufacture of

The invention relates to a rat cubilin protein. Cubilin is a ligand-
binding, epithelial glycoprotein receptor that facilitates uptake of
intrinsic factor/vitamin B12 complexes in intestines and Kidney. It is
also involved in endocytosis and trafficking of light immunoglobulin
claims in renal proximal tubule cells. Host cells containing a vector
comprising the rat cubilin DNA sequence can be used for the recombinant
expression of the protein. Cubilin, or its fragments, are used to treat
or reduce toxicity, particularly in Kidneys, spheen, brain, liver, heart
and thyroid. Cubulin mutations may also be implicated in idiopathic
proteinuria, fetal malformation, poor fetal development and spontaneous
proteinuria, fetal malformation, poor fetal development and spontaneous
proteinuria, fetal malformation, poor fetal development and spontaneous
contist detection, or clones that express it, in standard immunoassays.
Fragments of cubilin DNA can also be used to detect cubulin mRNA in cell
and tissues, by hybridization. Abnormal levels of cubilin in the urine
are indicative of kidney damage. Sequences ANY27021-35 represent EGF
repeat sequences of rat cubilin and from homologous regions of other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ·.

The invention discloses a polynuclectide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel colypeptides. Also claimed is a polypeptide encoded by the polynuclectide or its partial peptide, an antibody binding to the polypeptide or peptide or peptide of the polynuclectide by contacting the polypeptide or peptide or peptide by contacting the polypeptide or peptide or peptide by contacting the polypeptide or peptide or the polynuclectide by contacting the polypeptide or peptide or peptide between the two, a transformant carrying the polypuclectide in an expressible manner and an antisense polynuclectide. The oligonuclectide is useful as a primer for synthesising the polynuclectide and encoded or contacting the polynuclectide. The polynuclectide and encoded or proteins are useful as pharmaceutical agents and many disease-related genes may be included in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets or genes therapy. The genes are involved in tissue and/or cell credencation. Membrane proteins, signal transduction-related proteins, correctine the activity or expression of the encoded proteins and genes or encoding them can be used as indicators for diseases (e.g. osteoporosis, the activity or expression of the encoded protein to treat diseases. The correct presented is a protein of the invention. Note: Some of the sequence data for this patent is not represented in the printed correction of the correction of the invention supplied by the correction of the correction of the invention supplied by the correction of the invention supplied by the correction of the invention of the printed information supplied by the correction of the invention of the printed information supplied by the correction of the invention of the invention of the correction o

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents novel infection-specific protein IncB of chlamydia psittaci strain GPIC. IncB is found in the inclusion membrane of infected cells. It is associated primarily with the vegetative reticulate body form of Chlamydia rather than with the refractile elementary body form. The invention includes: a vaccine directed against the reticulate body form of Chlamydia comprising 1 or more infection-specific proteins (see AAY3170-78), including IncA, IncB and IncC; methods of using and producing such a vaccine; methods for detection of methods of using therapeutic agents specifically directed against infection-specific antibodies or antigens in a biological specimen; and a method of using therapeutic agents specifically directed against infection-specific peptides, or the genes that code for such peptides, to real chlamydial infection. (Updated on 17-OCT-2003 to standardise OS

New Acinetobacter baumanii proteins and nucleic acids, useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or as biocontrol agents for
                                                                                                                                                                   The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS7137-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

Sequence 7, Application US/09761636A

Patent No. US20020065218A1

GENERAL INFORMATION:
APPLICANT: ACHEN, MAXC

APPLICANT: STACKER, Steven

APPLICANT: CENDROW, Angela

TITLE OF INVENTION: VEGF-D/VEGF PEPTIDOMIMETIC INHIBITOR

FILE REFREENCE: 1064/48505 Achen et al

CURRENT APPLICATION NUMBER: US/09/761,636A

CURRENT FILING DATE: 2001-01-18

PRIOR PILING DATE: 2000-01-18

PRIOR PILING DATE: 2000-01-18

PRIOR PILING DATE: 2000-01-18

PRIOR PILING DATE: 2000-01-18

PRIOR PILING DATE: 2000-05-16

NUMBER OF SEQ ID NOS: 34

SOFTWARE: PatentIn Version 3.0

Patent No. 6551795

GENERAL INFORMATION:
TITLE OF INVENTION: ARRUGINGS AND THERAPEUTICS

TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: 107196.136

CURRENT APPLICATION NUMBER: US 60/074,788

PRIOR APPLICATION NUMBER: US 60/074,788

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 20960

LENGTH: 90
